The purpose of this study is to find out whether there is a relationship between smartphone addiction and life satisfaction in the university students. Kwon et al. (2013) says smartphone addiction is a behavior of attachment or addiction to smartphones that make it possible for social problems as well as withdrawal, and difficulties in the performance of everyday activities. Then according to Diener et al. (1985) life satisfaction refers to the cognitive processes and assessment processes in his life. This study was conducted by obtaining the subjects as many as 400 students. This research also uses quantitative research method with correlation test using spearman correlation. Based on the results of research that has been done on the relationship between smartphone addiction and life satisfaction in university students there are results of  $r (400) = -0.018$  and  $p = 0.722 > 0.05$  indicating that there is no correlation or relationship between smartphone addiction and life satisfaction in university students.

Keywords: smartphone addiction, life satisfaction, university students
