Background

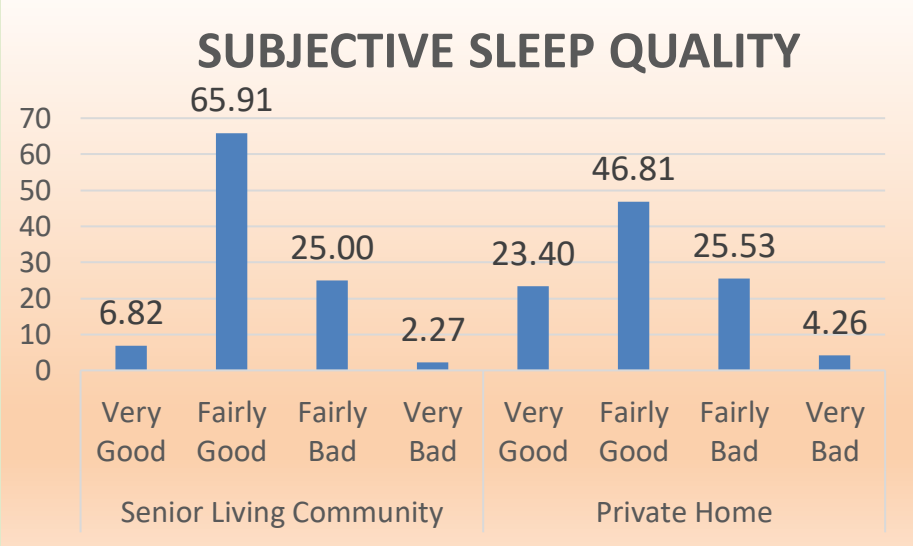

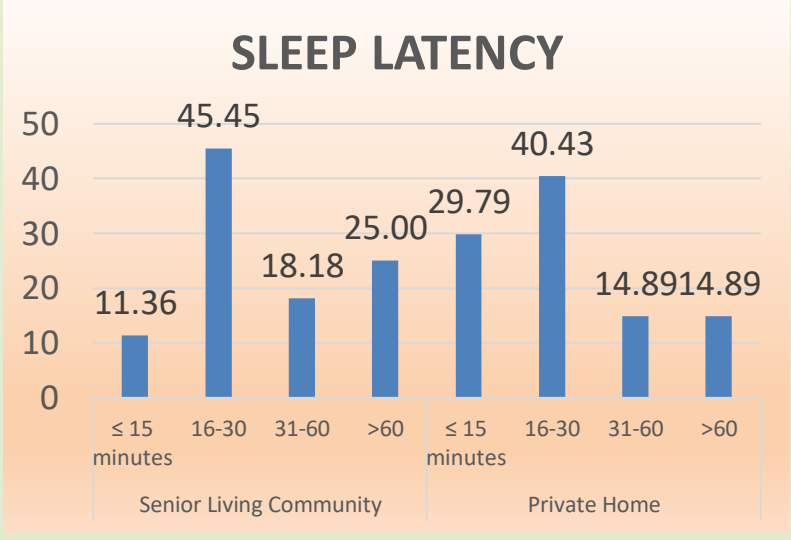

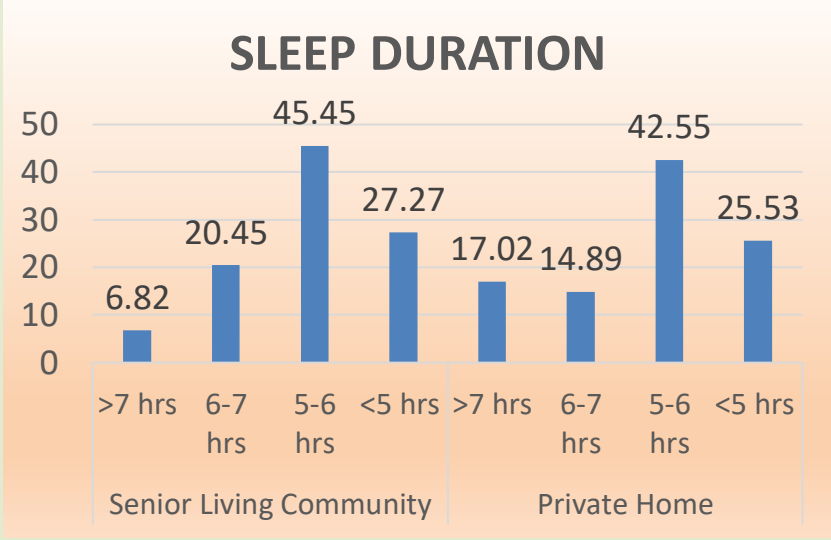

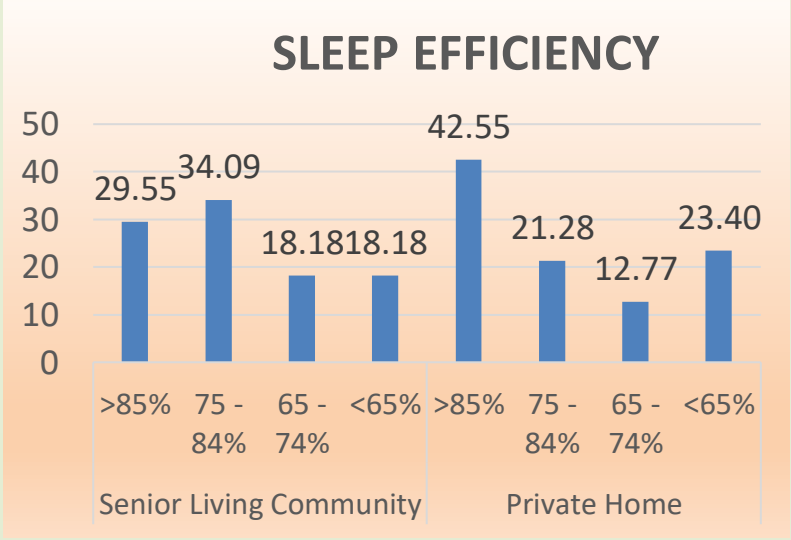

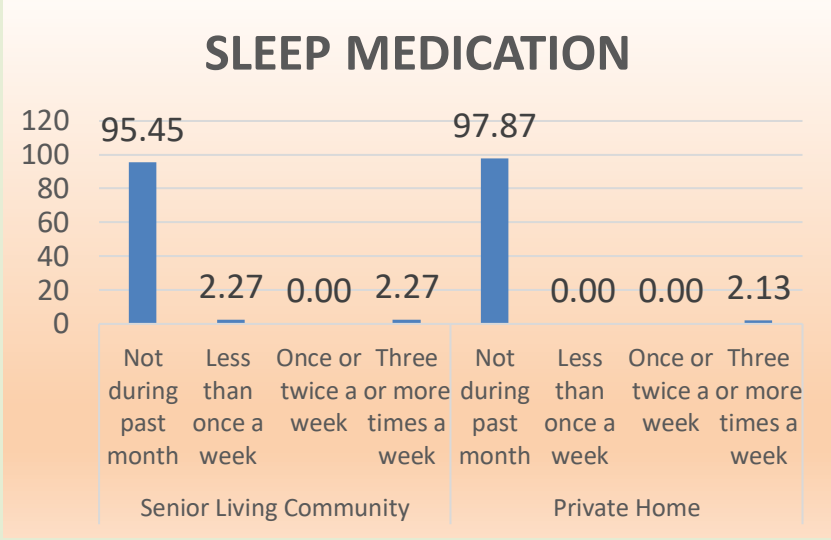

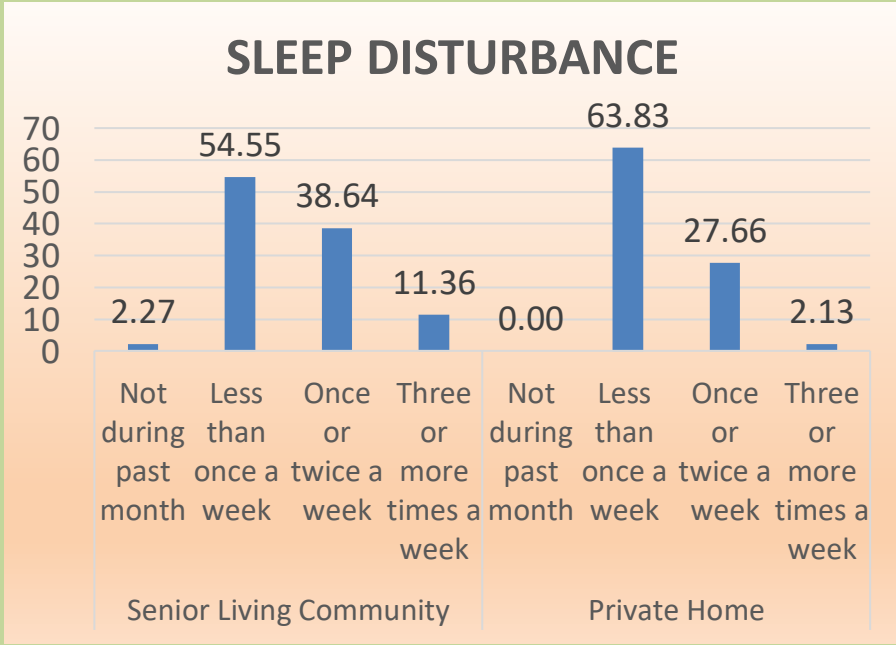

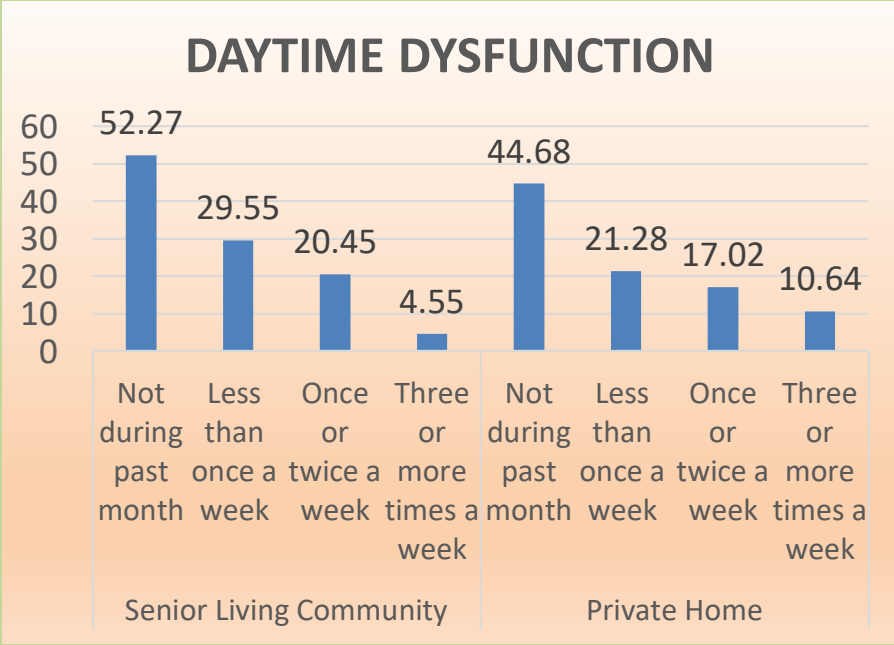

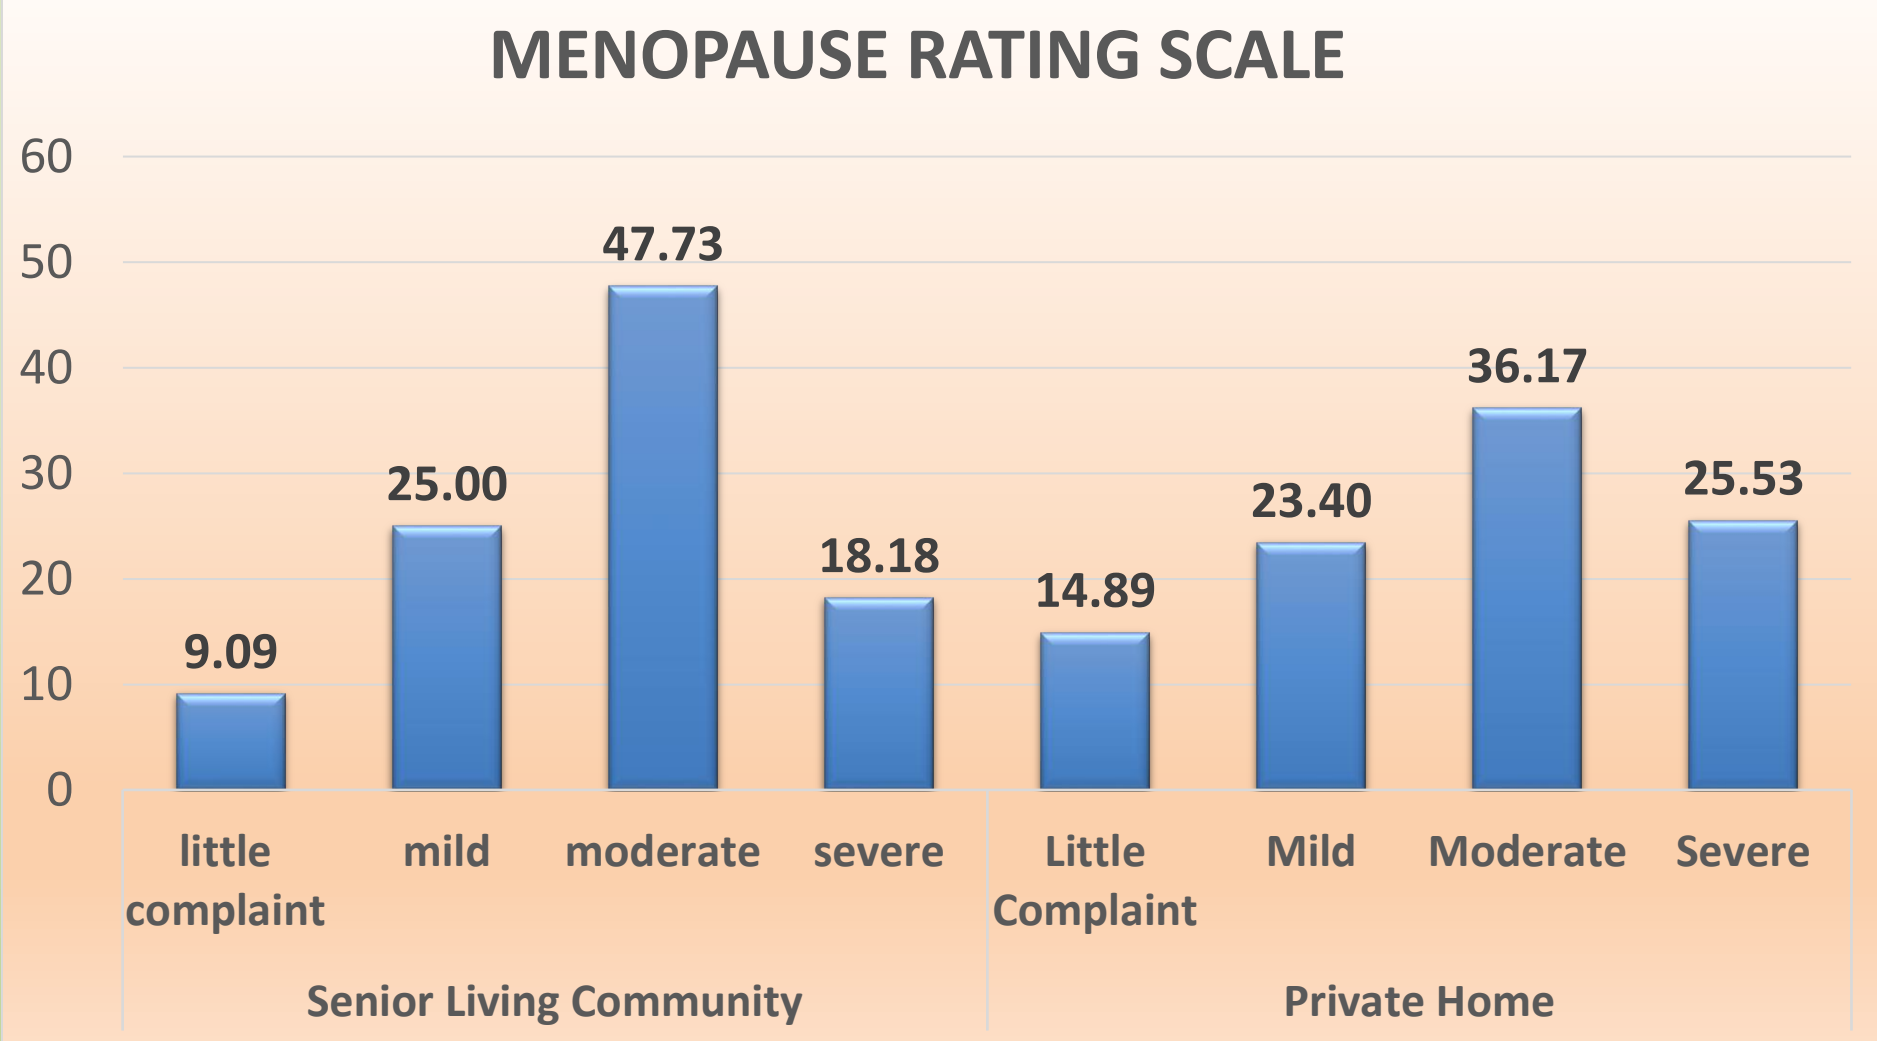

Currently, the number of female elderly in Indonesia is 5.2% of the total population and the majority of them live with their spouse or family. Family is the most important social support considering that they can provide optimal health care to improve their quality of life. Furthermore, good sleep quality is an essential part of having a high quality of life. However, menopausal symptoms may have a detrimental impact on sleep quality and cause sleep disruption. Identifying other aspects like social and environmental factors concerning sleep quality in postmenopausal women may be necessary to increase the quality of life.

Objectives

This study aimed to compare the sleep quality of postmenopausal women who live in senior living communities with those living in private homes with their spouse or family.

Methods

The cross-sectional study was conducted on 91 postmenopausal women (age 68.43± 11.45) and divided into two groups. The Pittsburgh Sleep Quality Index (PSQI) questionnaire was used in this study to get an analysis of sleep quality. The Menopause Rating Scale (MRS) was used to collect secondary data on the menopausal symptoms in participants. Chi-square test was used to to determine whether there was a statistically significant difference result between two groups.

Results

The prevalence of poor sleep quality in group of postmenopausal women who stay in senior living communities was 91% versus 64% in group who live in with spouse or family based on the PSQI measures. Statistical analysis showed a significant difference of sleep quality between two groups, with p= 0.003. In both groups, the use of sleep medication was almost none in the past month. Additionally, 18.18% of participants group in senior living communities suffered from severe menopausal syndrome which assessed by the MRS.

Bivariate Analysis		Sleep Quality by Pittsburgh Sleep Quality Index (PSQI)		PR	P
		Poor (N)	Good (N)		
The dwelling place	Senior Living Communities (N)	40	4	1.47	0.003
	Private Home (N)	30	17		

Conclusion

The prevalence of poor sleep quality was high among postmenopausal women, mainly in those who live in senior living communities.

Keywords

postmenopausal, menopausal symptoms, sleep quality, PSQI, MRS
